

# THE PEST SOCIETY

Peter Adamis 4 December 2016

In life we come across many types of pests that infest our environment. They come in all shapes and sizes, colours of the rainbow, smelly, dirty, bright, dark, ugly and in some cases beautiful pieces of art that one wonders how in heavens name can such a beautiful creature become a pest.

On the other side of the coin we have what I call the invisible pests, the ones are constantly hanging around like a bad smell, feeding on and off the carcasses of dead animals like the carrion that they are. Yes they could be buzzards, hyenas, vultures, jackals perhaps and who knows they may even come in human form.

Yesterday I had a strange encounter of the latter, the human pest who is also a known key board warrior, who is nothing but a worm, known for being a miserable little bastard to say the least. Fit only for crocodile meat. I had this strange mobile text full of bravado, threatening me if I did not stop exposing him to the world for the little pest that he is. Well I have news for him and his "Louie the fly" mates. I will not use mortein to eradicate this pest from the environment but use subtle means of extermination. They do say that you can skin a cat in more ways than one, but how does one skin a pest that has the brain power of a worm.

Well I thought I had better write an article about pests in our environment and given them new scientific names that best describe their character. If readers can provide better descriptions, I am more than happy to oblige. Mind you I must keep to using Greek to describe them on a scientific basis and keeping in line with normal and expected paradigms. There are 13 new species that have been catalogued according to their status and longevity within the confines of the Pest society.

1. **Heliopilis Saganitis.** Saganitis the self-style pest leader who consciously undermines everyone; is the same pest who constantly lives in the dark, feeds on lies and fables. Saganitis is not your traditional pest but tries hard to emulate one. According to the Pest Catalogue, Saganitis and has been expelled for impersonation.

2. **Asparitis Profilitis.** Profilitis is a bright young pest who given his youthful age demonstrates great leadership skills within the Outcast Society. According to the Pest Catalogue he is not a member of the society and considered "pest non grata".

3. **Ignoramus Stigmatizes.** A distant relative of Saganitis, Stigmatizes is of dubious origins, a pest who has a habit of undermining others in order to obtain the upper hand. According to the Pest Catalogue, Stigmatizes is not a member and has been expelled.

4. **Caractus Horribilios.** Horribilios is believed to be an illegitimate pest related to Pasagitis and is known to contact the financial institutions in an attempt to freeze funds. According to the Pest Catalogue, Horribilios is not a member and has been expelled.

5. **Ingratitus Dermatitits.** Dermatitits is known for contacting the Consumation Bureau requesting meditation. According to the Pest Catalogue, Dermatitits is not a Life Member and was expelled.

6. **Foustanelitits Orangitits.** Orangitits is one of the oldest of the pest varieties who has been around a long time and has managed to survive the ravages of time. According to the Pest Catalogue, Orangitits is not a Life members, expelled and a pest non grata.

7. **Tantalitits Pasagitits.** Pasagitits is a good example of a pest who lives in the dark feeding of faecal matter. According to the Pest Catalogue, Pasagitits is not a Life member and was expelled

8. **Anginitits Ksipolitits.** Ksipolitits is known pest for their clinging nature and burrowing features. According to the Pest Catalogue, Ksipolitits is not a member and a pest non grata.

9. **Pandilikas Dermalitits.** Dermatitits is distantly related to Dermatitits but of an entirely different breed of pest. Dermatitits seeks the light but like a moth often gets burnt. According to the Pest Catalogue, Dermatitits is not a Life member and a pest non grata.

10. **Kostipanitits Konquittrakits.** Konquittrakits is believed to be another of Pasagitits illegitimate brood but no proof has yet been determined. Konquittrakits failure to warn other pests is but one character defect. According to the Pest Catalogue Konquittrakits is not a life member and has also been expelled.

11. **Ambrositits Giranditits.** Giranditits is good friends with Profilitits and are often seen flying like bogon moths around City night lights with other bogon pests. According to the Pest Catalogue Giranditits is one of the few who have paid their Pest membership but is considered pest non grata.

12. **Saligari Obnoxities.** Obnoxities is a disgruntled pest who wants to be known as the Pest Messiah. A wannabee legend pest in his lifetime. Known to haunt dark cellars and feed off faecal matter like his mate Pasagitis. According to the Pest Catalogue Obnoxities does not exist.

13. **Silicosis Jongalitis.** Jongalitis is a self-seeking and undermining pest whose only qualification is the inability to be honest. Often seen eating faecal matter with his mates Pasagitis and Obnoxities. According to the Pest Catalogue Jongalitis does not exist.

Well there we have it. A whole new field of bugs with the exception of the rat who is synonymous with a variety of pests found today in our environment. For me it has been fun in being able to draw similarities with today's world and that of a make believe one. As I stated earlier, there is more than one way to skin a cat. This is but one of them. I am sure readers have better things to do than read the article above.

**Disclaimer.** Any similarities to live bugs, grubs, pests, animals or humans is purely coincidental. No bug, grub or animal was harmed during the making of the article and humane Photoshop techniques were utilised under observation by inspectors.

Please contact the author if identification of the bugs in real life can be confirmed. Only qualified academics may apply.

As always, apologies to purists for my poor grammar and savagery of the English language. I wish you all well and hope that this article does not cause ambiguity in the minds of those who read it.
